DETAILED ACTION

Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-12 and 16-21 are drawn to streaky noise detection and removal in an image reading device
- II. Claim 11 is drawn to selecting image data for output from image data items belonging to a majority side when inconsistencies of image data are generated in succession between reading parts.
- III. Claim 12 is drawn to selecting image data for output from image data items with the least difference there between when inconsistencies of image data are generated in succession between reading parts.
- IV. Claim 13 is drawn to a selecting a reading part for generating output images by user instruction.
- V. Claim 14 is drawn to switching the reading part for generating output images into another reading part when noise is detected in the image data during reading.
- VI. Claim 15 is drawn to switching the reading part for generating output images into a reading part having the smallest quantity of measured noise.

The inventions are distinct, each from the other because of the following reasons:

Inventions I-VI are separate combinations, which are distinct from each other if they are shown to have separate utility. In the instant case, invention I has separate

utility similar conventional image reading devices which include the feature of detecting and eliminating noise from image data output from the image reading sensor.

Inventions II through VI each have separate utility in that each invention has a distinct technique for selecting or switching between the output image data or the image reading part to avoid problems with correctly reading an image and generating correct output image data. See MPEP § 806.05(d).

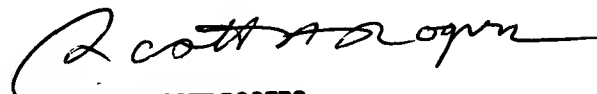

Because these inventions are distinct for the reasons given above and the search required for the distinctive features of each invention is unique, restriction between Groups I-VI for examination purposes as indicated is proper.
